INTRODUCTION

This publication provides population pyramids for Ohio and each of its 88 counties. This is a companion publication to ESO No. 1914, "Age and Sex Reference Tables for Ohio Counties, 1990". That publication contains the age data upon which these population pyramids are based.

Age is one of the most relevant of all population characteristics. It is the basis for understanding many of the conditions and events for a nation, state, county or local area. Birth and death rates, school enrollment, demand for jobs and housing, labor force structure and demand for services related to the elderly are all directly tied to the age structure of the population.

Population pyramids (often referred to as age-sex pyramids) are a good way of graphically portraying age structure. The percentage of population in each five-year age group is represented by a bar. The left hand side of the bar represents the male population of the age and the right hand side of the bar represents the female population. The youngest ages are at the bottom of the pyramid with the oldest age groups at the top. One can make intelligent guesses about many aspects of the population from looking at a pyramid. For example, a pyramid with a very broad base would likely represent a population with a high birth rate. For an example of this, look at the pyramid for Holmes county. Holmes county has the highest birth rate in Ohio, largely due to the Amish influence. If the pyramid has a substantial indentation in the middle (e.g. ages 35 to 45 years) one could speculate that birth rates were low 35 to 45 years ago, or that many of those ages have migrated from the area. Abnormally large populations in particular ages are often the result of institutional populations. The pyramid for Athens county, for example, clearly reveals the college aged population at Ohio University.

Imbalances in the percentages of males and females could result from differential death rates or from the presence of unique institutional structures in the area. For example, most pyramids are asymmetrical at the top because females have a substantially longer life expectancy than males. Madison county has an asymmetrical pyramid in the ages 20 to 49. Most of this is due to the male prisoner population at the London Correctional Institution. Pickaway county is another example of the same phenomenon.

The first two pyramids that follow depict the population of Ohio for 1980 and 1990. One can easily visualize the aging of the baby boom population over time as well as the stabilized birth rate. County pyramids are presented alphabetically following the state pyramids.
